

Ans 2. The chloroplast is the organelle involved in photosynthesis. It contains chlorophyll which absorbs light energy.

Ans 1. The artery carries blood away from the heart. The aorta is the largest artery.

Ans 5 (b) The iodine test is used. Iodine turns blue-black when starch is present.

Ans 5 (a) In the dark there is no light energy, so photosynthesis stops and no new starch is made. The stored starch gets used up by the plant.

Ans 4. Transpiration is the loss of water as water vapour from the leaves of a plant through the stomata. Water evaporates from the mesophyll cells and diffuses out.

It creates a suction pull that helps water move up the xylem from the roots.

(remember to revise diagrams for next test!!)

Ans 4 continued. Two factors that increase the rate of transpiration are: 1. Higher temperature 2. Wind / air movement. Dry air also increases it.
